Pillow blocks

Technical drawings: Pillow blocks

The pillow block bearing to DIN 736 is complete with rolling bearing, tapered bore and adapter sleeve. The housing is equipped with a felt seal on both sides according to DIN 5419. This series is particularly suitable for intermediate support of highly flexible connecting shafts as the adapter sleeve can be fixed on the outside diameter of the tube.

To avoid distortions, only one pillow block may be implemented as a fixed bearing when more than one pillow block is used.
